Wantace — Part E: Video Outline & AI Note

Use these prompts to speak naturally for five minutes. Do not read word-for-word. Replace bracketed items with genuine observations.

Five-minute video cue card

0:00–0:30 — Introduce yourself and the objective of the assignment.

0:30–1:40 — Describe the real business you visited/called, what surprised you, and one specific observed workflow problem. Include only verified facts and exact quotes.

1:40–3:00 — Explain what the Vardhan pack reveals indirectly: operational visibility and reliable updates are the core issue; requested AI and marketplace features are not the first priority.

3:00–4:15 — Explain your Phase 1 decision and why you deferred sales prediction, marketplace integrations and ERP replacement.

4:15–5:00 — Say what you would change with another day: validate statuses with Ramesh, reconcile duplicate-looking records with Kunal, and test adoption with actual users.

AI-use note — edit to match what you actually did

I used ChatGPT to organise the assignment requirements and structure a first draft of the Vardhan specification. I used it to identify inconsistencies across the supplied call notes, WhatsApp export and order-sheet extract. I reviewed the recommendations against the source pack and kept the first release focused on order visibility rather than speculative AI features. AI cannot conduct the required business visit, obtain consent, provide genuine owner quotes, or create authentic evidence of the current process. I therefore left Part A evidence fields for my own fieldwork. I will verify all quantities, workflow assumptions and final wording before submission. One limitation to watch for is that AI can turn uncertain interpretations into confident statements; I treated disputed order counts, online growth and steel variance as items to validate rather than established facts.

Before sending: retain only tools and actions you actually used; add one concrete example of a generic or incorrect AI suggestion you corrected.
